DEPARTMENT OF CIVIL ENGINEERING

Academic Year 2021 – 22

Course	Geotechnical Engineering	Year / Semester	III/ I
Topic	Boussinesq's theory for Point load,Uniformly loaded,Circular, Rectangular Areas	Innovative Method Chosen	**Flipped Classroom**

Flipped Classroom:

Flipping the classroom is an inverting the classroom approach to teaching. In this approach, the traditional in-class teaching is "flipped" to better meet the needs of individual learners. Students gain control of the learning process through studying course material outside of class, using readings, pre-recorded video lectures. It helps the faculty/lecturer to redefine in-class activities and include homework problems and keep the students engaged in the content.

Details of the Implementation:

It Works

1. Before class: Students watch recorded lectures, audio–video lessons, or read study materials related to Boussinesq's theory, including stress distribution due to point load, uniformly loaded areas, circular areas, and rectangular areas.
2. During class: Students participate in activities, group discussions, numerical problem-solving, and concept-based exercises. The teacher guides the students, clarifies doubts, and provides individual support, resulting in more interactive and practical learning.

It is useful

Students can learn the basic concepts of stress distribution in soil due to external loads at their own pace. More classroom time is available for discussion and doubt-clearing. It encourages active learning, better engagement, conceptual understanding, and application of Boussinesq's theory in foundation engineering.

Example: A civil engineering teacher explains Boussinesq's theory using a short video before the class, covering stress distribution due to a point load and uniformly loaded areas. Students watch the video at home. The next day in class, they work in groups to solve numerical problems involving point loads, circular loaded areas, and rectangular loaded areas, while the teacher guides them in calculating vertical stress at different depths and locations and

DEPARTMENT OF CIVIL ENGINEERING

Date: 10-11-2021

To
The Principal,
Brilliant Institute of Engineering and Technology,
Adbullapur (V & M) - 501505,
R. R. District, Hyderabad.

Respected Sir,

Sub: Seeking Permission – Innovative TLP – Req. – Reg.

* * *

We are hereby bringing to your kind notice that the department of Civil engineering department is going to conduct an innovative session i.e., flipped class room conducting by our faculty members to our students. where the traditional learning order is reversed Students learn the lesson before class. A technique where people share ideas freely without criticism to solve a problem or think creatively. We are scheduled the program on 26-11-2021 at 9:15 am to 10:55 am to III year I semester. This will be a good knowledge sharing platform for students.

We are confident that you will continue to serve the institution diligently and will have a satisfying and rewarding career with the institution.

In this regard, we are requesting you kindly permit us to conduct the program to the students.

Thanking you sir.

Yours Sincerely,

Head of the Department

Circular

This is to inform faculty members and students in the department of civil engineering that the department is going to conduct a flipped class room involving faculty along with students (In Geotechnical Engineering on Boussinesq's Theory) on 26-11-2021 between 9:15 am to 10:55am. This will be a good knowledge sharing platform for students' ideas and solutions through disciplined idea generator on this method. Hence, it is directed that all the students of III year I Semester and who are interested to participate enroll their names with concerned faculty on or before 25-11-2021.

DEPARTMENT OF CIVIL ENGINEERING

Flipped classroom :

A flipped classroom is a modern teaching method where the traditional way of learning is reversed.

Explanation:

In a normal classroom, faculty teaches the lesson in class. Students do homework after class Students learn the lesson at home (through videos, presentations, readings), Students do activities, discussions, problem-solving in class with the faculty help.

	
19QA1A0118,20QA5A0157,20QA5A0147,20QA5A0119	Writing Notes Boussinesq's Theory

It Works

1. Before class: Students watch recorded lectures, audio–video lessons, or read materials.
2. During class: Students do activities, group work, problem-solving, Teacher guides, clarifies doubts, and helps individually, more interactive and practical learning

It is useful

Students learn at their own pace, More time for discussion and doubt-clearing, encourages active learning, better engagement and understanding.

Example: A math teacher records a video explaining algebra basics. Students watch it at home. Next day in class, they solve algebra problems in groups while the teacher helps.

DEPARTMENT OF CIVIL ENGINEERING

Summary Report
On
Flipped class room

The Department of Civil Engineering conducted a Flipped Classroom session on the topic "Boussinesq's theory on point load ,uniformly loaded for circular and rectangular areas". The main objective of this event was to enhance the communication skills, debate skills, and technical knowledge of students. The activity also helped students develop confidence in expressing and presenting their understanding of the subject.

The event was organized in the form of a group discussion on properties of fluid in Geotechnical engineering, and their engineering applications. The session encouraged active participation and collaborative learning among students. It was mapped to Program Outcome (PO1, PO2 and PO3) which focuses on effective communication and teamwork.

A large number of students actively participated in the event and shared their views and knowledge on the topic. On this occasion, **Dr. Shaik Rusthum, Principal**, motivated the students to take part in such academic activities and appreciated their enthusiasm. He congratulated the organizing committee for successfully conducting the event and advised the faculty members to organize more such interactive learning activities to inculcate confidence, leadership qualities, and technical competence among students.

The program concluded successfully with positive feedback from both students and faculty members. The flipped classroom approach proved to be an effective method for improving student engagement, knowledge sharing, and conceptual understanding of Fluid Mechanics.

The competitive spirit among the students. The total number of students participated 32.
